

Sichon

— COMPANY BRIEF · 2026

Building the nation, *responsibly.*

BUILD THE NATION · JENGA TAIFA

The engineering desk of East Africa — engineering you can simply buy.

Engineering is not merely a technical profession — it is a *civic responsibility*.

Technology is the defining feature of the 21st century. Nations that harness it thrive; those that neglect it stagnate. Across Kenya, the infrastructure gap is not an abstraction. It is measurable — and so is the answer.

84.9%

of Kenya's roads are unpaved

140,099 of 164,967 km remain earth or gravel; county roads just 2.5% paved.

KNBS Economic
Survey 2024

1 in 4

Kenyans live without electricity

76% had power by 2023, up from 37% a decade earlier. The last mile is the hardest.

World Bank ·
OWID

2M+

housing units short — and growing

A national deficit widening by roughly 200,000 homes every year.

UN-Habitat ·
Vision 2030

46.5%

of urban Kenyans live in informal settlements

More than twice the global average — a call for drainage, walls, dignified public space.

UN-Habitat

The distance between what Kenya is and what Kenya could be is measurable. Sichon exists to *close it*.

FROM THE UNLIT GAP TO A PAVED, POWERED, GREEN NATION — THE SICHON SCROLL NARRATIVE, LIVE ON THE SITE

Not hours for hire. *Engineering you can simply buy.*

Every consultancy sells the same thing: the billable hours of engineers. Sichon does the opposite. We amortize engineering judgement into **calibrated tools**, compute your answer before you pay, and sell a fixed-price, **licensed-engineer-stamped** deliverable — with a printed price and a turnaround clock.

THE LOOP

The tools are honest by design — where competitors flatter their numbers, we print our assumptions. Verified honesty is the one advantage a rival cannot copy without abandoning their own sales pitch.

THE DIFFERENCE

A Nairobi consultancy quotes three weeks and hundreds of thousands of shillings for a rooftop-solar feasibility. Our tool computes the same first-pass answer in **400 milliseconds**, in the client's browser, free, at 11 p.m. We did not hire faster engineers — we changed the nature of the deliverable.

Real physics, in your browser. *No email required.*

TOOL 01 • LIVE

YOUR COUNTY

Kisumu

MONTHLY POWER BILL (KSH)

8000

USABLE ROOF AREA, M² (optional)

Leave blank if unsure

Assumes grid-tie, no battery • self-consumption 65% (net metering is not yet operational in Kenya) • install cost KSh 70,000–110,000/kWp • KPLC all-in tariff ≈ KSh 28/kWh.

PRELIM • FOR PLANNING

Kisumu • 4.7 kWh/kWp/day

2.2 KWP SYSTEM

PANELS (550 W)	ROOF NEEDED	YEARLY GENERATION
4	11 m ²	3,774 kWh
MONTHLY SAVING	INSTALLED COST	PAYBACK
KSh 5,724	KSh 154,000–242,000	2.2–3.5 yrs

≈ **KSh 1.52M** net saving over 25 years — plus power through blackouts with a battery option.

Turn this into a stamped design — KSh 15,000 →

Planning estimate. Final design needs a site survey and review by a licensed engineer.

County-level Global Solar Atlas yields, current KPLC tariffs and real Kenyan install costs → system size, generation, payback — with every assumption printed on the result. Where rivals model 100% self-consumption and a net-metering regime Kenya does not have, we print 65% and say why. The honest number wins the client who checks — and that client is the one worth having. A free estimate becomes a paid, stamped design in one tap.

Built for Kenya's *flood season*.

SITE SLOPE

Gentle (1-2%)

FORMAL OUTLET NEARBY? (ROAD DRAIN, CULVERT)

No — the plot must handle its own water

Rational method ($Q = C \cdot i \cdot A$) with a 1-hr, ~10-year design storm • Highlands zone = 65 mm/hr (TRRL East African-derived) • Manning n 0.013, standard concrete pipes • roof C 0.90, paved 0.85, green 0.25.

PRELIM • FOR PLANNING

Highlands • 65 mm/hr design storm

5.9 L/S PEAK RUNOFF

CATCHMENT	RUNOFF COEFF.	PIPE REQUIRED
500 m ²	C = 0.65	Ø 225 mm
AT SLOPE	STORM VOLUME	RETAIN ON-PLOT
Gentle (1-2%)	21 m³/hr	11 m³ ≈ 4 soak pits

No formal outlet — the site must soak or store its own storm water on plot.

Get the full assessment — KSh 45,000 →

Planning estimate. Final design needs a site survey and review by a licensed engineer.

Rational-method peak runoff against your climatic zone's design storm, Manning full-flow pipe sizing, and how much water your plot must hold when there is no outlet — the exact questions Kenyan sites fail on every rainy season. Each new instrument is built in a single working session; retaining walls, roads, site feasibility and greening follow the same pattern. The marginal cost of a new engineering tool approaches zero — and the market has not yet repriced this.

A printed price. A real deadline. *A stamp behind it.*

No “request a quote” theatre. Fixed-price, tool-accelerated deliverables, reviewed by a licensed engineer before they leave the desk.

DELIVERABLE	PRICE	TURNAROUND	STATUS
Stamped solar design	KSh 15,000 ≈ \$116	72 HOURS	Open
Site feasibility snapshot	KSh 30,000 ≈ \$233	5 DAYS	Open
Drainage & flood assessment	KSh 45,000 ≈ \$349	7 DAYS	Open
Retaining wall preliminary design	KSh 60,000 ≈ \$465	7 DAYS	Q3 2026

MONEY TRAFFIC — WORLDWIDE

Nairobi, London, Dallas, Dubai. A diaspora client can fund a family project from anywhere — with milestone escrow released on engineer-verified progress.

COMMISSION IN ONE TAP

Order on WhatsApp with a 50% deposit; balance on delivery. The storefront runs on the network Kenya already uses — no app to install, no friction.

— WHY IT HOLDS — AND WHERE IT GOES

The code is public. *The moat is not.*

Anyone can copy a website. No one can copy the Kenya-tuned calibration we keep fresh, the trust earned one honest number at a time, the speed of an instrument per session, or the licensed engineers who stand behind every stamp.

THE HORIZON — EARNED STAGE BY STAGE

H1 Stamped SKUs

Solar, drainage, walls — fixed-price deliverables. Live now.

H2 Design-build

Own small works end to end; margin moves from the drawing to the project.

H3 Sichon Towers

Land, design, build, hold — own developments, not just serve them.

H ∞ The engineering desk of Africa
